

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME: Julie A Siegenthaler

eRA COMMONS USER NAME (credential, e.g., agency login): siegenthaler

POSITION TITLE: Associate Professor

EDUCATION/TRAINING (*Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.*)

INSTITUTION AND LOCATION	DEGREE (if applicable)	Completion Date MM/YYYY	FIELD OF STUDY
Mount Holyoke College, South Hadley MA	B.A.	05/2000	Neuroscience & Behavior
SUNY Upstate Medical Univ, Syracuse NY	Ph.D.	07/2005	Neuroscience
SUNY Upstate Medical Univ, Syracuse NY	Postdoctoral	05/2006	Developmental Neurobiology
University of California, San Francisco San Francisco CA	Postdoctoral	06/2012	Developmental Neurobiology

A. Personal Statement

My research goal is to elucidate important signaling between non-neural structures, the meninges and cells of the neuro-vasculature, and the brain required for normal development, adult function and how these are perturbed in disease and brain injury. Projects in my lab use mouse genetics, ex vivo and culture models, single cell transcriptional profiling and animal models of adult brain injury (stroke, traumatic brain injury, viral encephalitis) to address these important questions in CNS biology.

I have a long-standing interest and expertise in meninges development and function, particularly as it relates to control of developmental and adult neurogenesis. I will bring this expertise to experiments in this proposal to generate a cellular This is an exciting proposal as the meninges is well known to be a critical source of signals required for mammalian brain development but thus far no attempt has been made to add meninges to a brain organoid system. As a post-doc, I was an integral part of characterizing mice with mutations in the meningeal-expressed gene *Foxc1* and developing these mice as a model to study how the meninges regulate brain development. I discovered that Retinoic acid (RA) synthesized by the meninges regulates symmetric and asymmetric divisions in neocortical progenitors (Siegenthaler et al., 2009 *Cell*). In my independent group at the University of Colorado, Anschutz Medical Campus (CU AMC) we have made important progress toward understanding how meningeal-derived RA functions in cerebrovascular development (Bonney et al., 2016 *J of Neurosci*; Mishra et al., 2016 *Dev Bio*; Bonney et al., 2017 *eNeuro*) and adult neurogenesis (Mishra et al., 2018 *Stem Cell Reports*). Important for this application, my lab has generated a first-ever molecular atlas of the developing mouse meninges and validated that mouse and human meninges share important molecular characteristics (DeSisto et al., 2019 *bioArchiv*). My lab's data will be invaluable for meninges-related projects in the application, permitting us to 1) properly evaluate the cellular content of meninges 'transplants', 2) identify meninges-derived signals that may be important for brain organoid growth and differentiation 3) identify developmentally relevant genes and pathways that can be used to generate human iPSC-derived meningeal cells.

B. Positions and Honors

Positions and Employment

08/00-07/05	Graduate Student, Department of Neuroscience and Physiology, SUNY Upstate Medical Syracuse, NY
08/05-4/05	Postdoctoral fellow, Department of Neuroscience and Physiology, SUNY Upstate Medical Syracuse, NY
05/06-06/12	Postdoctoral fellow, Department of Neurology, University of California, San Francisco, San Francisco, CA
07/12-07/2019	Assistant Professor, Career Track, Department of Pediatrics, Section of Developmental Biology, University of Colorado School of Medicine, Aurora, CO
07/19-present	Associate Professor, Career Track, Department of Pediatrics, Section of Developmental Biology, University of Colorado School of Medicine, Aurora, CO

Other Experience and Professional Memberships

2006-Present	Member, Society for Neuroscience
2014-Present	Member, North American Vascular Biology Organization

Honors and Awards

2006	Fetal Alcohol Syndrome Study Group Travel Award (Research Society on Alcoholism)
2007-2009	Lawrence M. Brass, M.D. Stroke Research Postdoctoral Fellowship Award (AHA/AAN)
2010-2015	K99/R00 Pathway to Independence Award (NS070920) National Institutes of Health/NINDS

C. Contribution to Science

1. During my PhD and a one year post-doc at SUNY Upstate Medical University, I investigated the molecular mechanisms underlying teratogenic and genetic causes of microcephaly. For my PhD work, I studied Fetal Alcohol Syndrome (FAS) associated defects in neocortical development, demonstrating that Transforming growth factor- β (TGF β) signaling was involved in promoting both progenitor cell cycle exit and neocortical migration and that these functions of TGF β were impaired by alcohol exposure. This work provided important new insight into how a pregnant mother's alcohol consumption perturbs normal brain development through modulation of TGF β 1. *FOXG1* is a disease gene for Rett syndrome of which microcephaly and developmental delay is a major feature. We found that heterozygosity of *Foxg1*, of which some Rett syndrome patients have, caused reduced production of intermediate progenitor cells in the neocortex and reduced neuron generation. We identified loss of Foxg1-mediated inhibition of CKI p21 as a mechanism leading to premature exit of ventricular zone progenitors from the cell cycle. Our work on Foxg1 in telencephalic development not only provided knowledge regarding the cause of microcephaly in human patients with *FOXG1* mutations but also outlined a novel mechanism by which TGF β signaling regulates birth of Cajal-Retzius cells during early brain development.

2. During my postdoctoral training at UCSF, I began an incredible research 'odyssey' to understand how signals made by the meninges are needed to regulate brain development. We found that mice with mutations in the forkhead transcription factor *Foxc1* fail to form meninges around the neocortex and, as a result, have enlarged

cerebral hemispheres. We showed that these defects in neocortical development result from failure of neocortical progenitors to switch from symmetric to asymmetric, neuron generating divisions due to lack of meningeal derived retinoic acid (RA). This work represented a significant advancement in our understanding of corticogenesis, solidified the meninges as a major regulator of neocortical development and identified defects in meningeal development as a possible cause of focal cortical dysplasia in human patients. In my independent lab at CU AMC, we have shown that RA plays an important role in adult stem cell niches and, in particular for the adult hippocampus, the meninges are likely an important source of RA for this adult niche. To advance our studies on meninges development and function, we have generated a molecular atlas of the embryonic forebrain meninges. We expect this to be an important resource

3. Supported AHA/AAN grant and later by my K99-R00 Pathway to Independence Award and an AHA Beginning Grant-in-Aid, I focused the latter half of my post-doctoral work and now work in my lab at CU AMC brain pericyte function in vascular development and the response of pericyte subpopulations to brain injury. I have shown that *Foxc1* has important roles in pericytes during brain vascular development. Using pericyte-conditional *Foxc1* KOs, we show that *Foxc1* is needed to regulate pericyte proliferation. Also, *Foxc1*-deficient pericytes fail to inhibit endothelial cell proliferation leading to dysplastic, hemorrhage-prone vessels in the conditional mutants. This phenotype is particularly relevant in light of several publications describing cerebrovascular bleeds in patients with point mutations in or deletions that include *FOXC1*. Our lab has also taken the lead on characterizing the developmental origins and functions of a poorly understood but important pericyte subtype termed perivascular stromal cells (PSCs). PSCs have recently been shown to have a differential response to brain injury. Unlike pericytes that die in the injury core, PSCs proliferate to increase numbers and are the source of most fibrotic scar material. We have shown these cells are potentially derived from the meninges during post-natal brain development and that PSCs may have a separate function in the injury site, specifically a source of bioactive signals like RA that have the potential to be neuroprotective and anti-inflammatory.

4. Brain vascular development and vascular breakdown in disease is a major research focus for my lab at CU AMC. Using several animal models of RA deficiency and targeted disruption of RA signaling in brain endothelial cells, my lab has uncovered a previously unknown interaction between RA and the WNT pathway. Endothelial WNT signaling is absolutely required for development of the CNS vasculature however no pathways have been identified upstream of WNT in the CNS vasculature. We have found that RA is required to promote endothelial WNT signaling specifically in the neocortex via inhibiting expression soluble WNT inhibitors by cortical neural progenitors. Surprisingly, we have found that RA is required in brain endothelial cells to directly inhibit WNT signaling to prevent ectopic expression of WNT target *Sox17*. We have extended our interest in brain vascular development to understanding mechanisms of blood-brain barrier (BBB) breakdown in disease. Through a collaboration with neurovirologist Ken Tyler in the Dept of Neurology, we identified IFN-gamma as a key mediator blood-brain barrier (BBB) breakdown in Reo virus encephalitis. Our discoveries are providing important insight

into signaling mechanisms underlying brain vascular development and BBB breakdown in disease that we believe can be eventually applied to help 'normalize' vasculature integrity in brain pathologies.

D. Additional Information: Research Support and/or Scholastic Performance

Ongoing

R03 NS104566 – NIH/NINDS

Title: "Foxc1 control of meninges formation and function"

9/1/2018-8/31/2020

The project pilot grant is intended to create a molecular atlas of the developing forebrain meninges in wildtype and *Foxc1-KO* mice. This will generate a resource for investigations into meninges development and function and foster new lines of research into the function of Foxc1 in meninges formation.

Role: Principal Investigator (5% effort)

R01NS098273-01 – NIH/NINDS

6/1/2016-5/31/2021

Title: "Retinoic acid in the development of the CNS vasculature"

Projects in this grant will identify a role for RA signaling in controlling brain endothelial cell and pericyte proliferation required for vascular stability through regulation of WNT signaling and its target Sox17. Further, we will elucidate the function of RA in retinal vascular development and identify a role for RA deficiency in the developmental vascular pathology retinopathy-of-prematurity.

Role: Principal Investigator (30% effort)

Completed (>3 years)

Colorado Clinical and Translational Sciences Institute (CCTSI) -CNS Pilot Grant

1/1/16-12/31/16

Title: "Identification of signals that activate perivascular stromal cells and initiate fibrosis following CNS injury"

Projects in the grant will test potential ischemic cell types underlying activation of pro-fibrotic perivascular cell types following stroke injury and identify molecular pathways underlying cellular transformation that lead to fibrotic scar deposition.

Role: Principal Investigator
